

To obtain the best fit line over single feature scattered datapoints using Linear Regression

1. Load the basic libraries and packages

```
import pandas as pd
import numpy as np
import seaborn as sns
import matplotlib.pyplot as plt
```

2. Load the dataset

```
dataset = pd.read_csv("/content/Dataset.csv")
dataset.head()
```

	x	y
0	24.0	21.549452
1	50.0	47.464463
2	15.0	17.218656
3	38.0	36.586398
4	87.0	87.288984

3. Analyse the dataset

```
dataset.describe()
```

	x	y
count	700.000000	699.000000
mean	54.985939	49.939869
std	134.681703	29.109217
min	0.000000	-3.839981
25%	25.000000	24.929968
50%	49.000000	48.973020
75%	75.000000	74.929911
max	3530.157369	108.871618

4. Pre-process the data

```
dataset = dataset.dropna()
```

5. Visualize the Data

```
plt.scatter(dataset['x'],dataset['y'])
plt.xlabel('x')
plt.ylabel('y')
plt.show()
```

6. Separate the feature and prediction value columns

```
x_feature = np.array(dataset['x'])
y_feature = np.array(dataset['y'])
```

7. Write the Hypothesis Function

```
def Hypothesis(theta_array , x) :
    return theta_array[0] + theta_array[1]*x
```

8. Write the Cost Function

```
def Cost_Function(theta_array,x,y , m):
    total_cost = 0
    for i in range(m):
        total_cost += (Hypothesis(theta_array,x[i]) - y[i])**2
    return total_cost/(2*m)
```

9. Write the Gradient Descent optimization algorithm

```
def Gradient_Descent(theta_array , x, y , m ,alpha) :
    summation_0 = 0
    summation_1 = 0

    for i in range(m):
        summation_0 += (Hypothesis(theta_array,x[i]) - y[i])
        summation_1 += ((Hypothesis(theta_array,x[i]) - y[i])*x[i])

    new_theta0 = theta_array[0] - (alpha/m)*summation_0
    new_theta1 = theta_array[1] - (alpha/m)*summation_1

    new_theta = [new_theta0 , new_theta1]

    return new_theta
```

```
# 10. Apply the training over the dataset to minimize the loss
```

```
def Training(x, y, alpha, epochs):  
    theta_0 = 0  
    theta_1 = 0  
    theta_array = [theta_0, theta_1]  
    m = len(x)
```

```
# 11. Find the best fit line to the given dataset
```

```
alpha = 0.0001
```

```
epochs = 100
```

```
Training(x_feature , y_feature , alpha , epochs)
```

```
[0.014658108311688386, 0.9988297525870707]
```
